

TruthLens — Week 2: Design & Planning

cseku_26_wpl_truthlens — branch 0.2

Evidence-based AI analysis platform for text, image, and video misinformation and deepfake detection.

1. UI wireframes (desktop)

Six core screens cover the MVP: Home, Text analysis, Image analysis, Video analysis, Results (shared across all three types), and History. All screens share a persistent top nav (logo, section links) and a wide two-column layout on desktop — a primary action column plus a supporting sidebar (“How it works” / “What we check” / “Evidence”) that fills the extra horizontal space rather than leaving it empty. Home uses a single paste-or-drop input with auto type detection, rather than forcing a format choice up front.

Figure 1.1 — Home

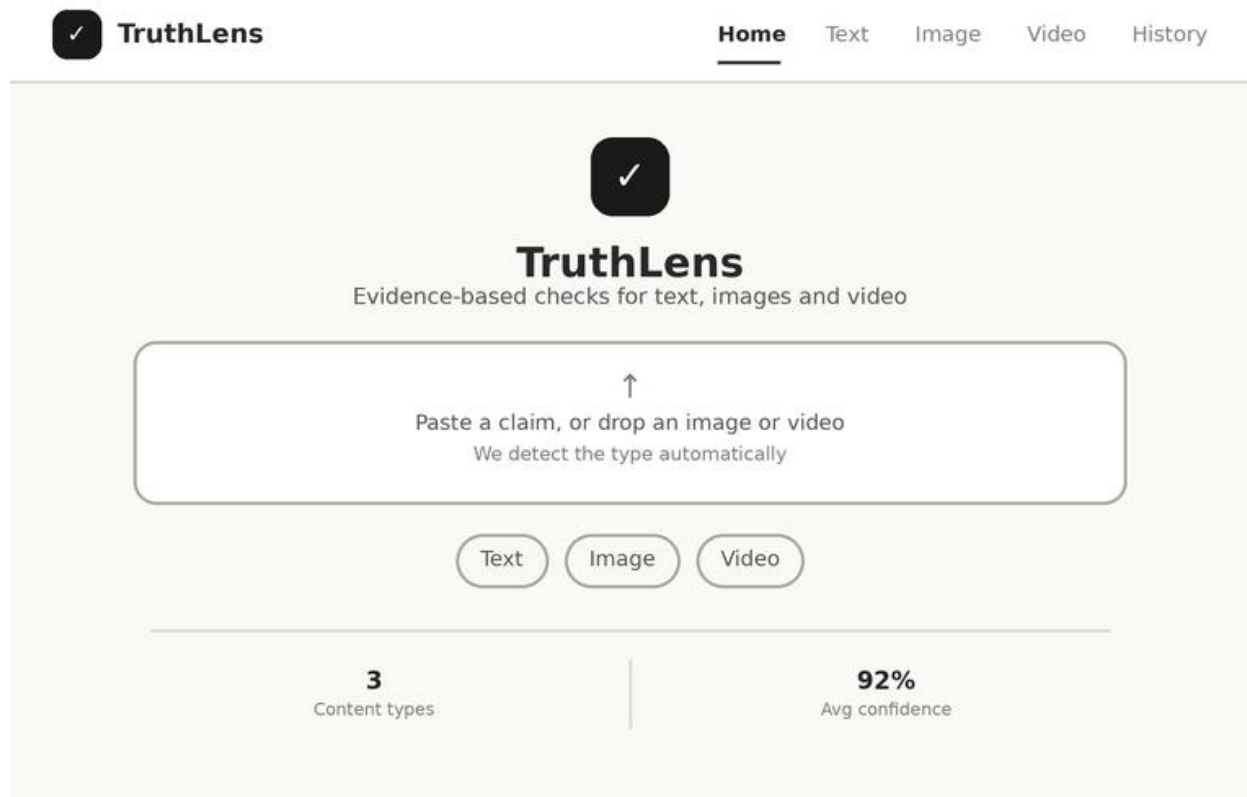

Figure 1.1: Home screen — persistent nav, a single paste-or-drop zone that auto-detects text, image, or video, format chips for explicit selection, and content-type / confidence stats below.

T

Check a claim

Paste text and we'll verify it against trusted sources

↑

Type or paste a claim to verify

"The Great Wall is visible from space"

0 / 500 · Plain text only

Check claim →

Cancel

How it works

- 1 We retrieve related evidence from FEVER
- 2 A verification model scores support / refute
- 3 You get a confidence score with sources

Figure 1.2a: Text analysis — claim input on the left, a “How it works” panel on the right.

What we check

1

Pixel-level generation artifacts

2

Known diffusion / GAN fingerprints

3

Metadata and compression history

Figure 1.2b: Image analysis — drop zone on the left, “What we check” panel on the right.

What we check

1

Frame-to-frame consistency

2

Facial landmark and blink analysis

3

Audio-visual sync artifacts

Figure 1.2c: Video analysis — drop zone with a sampled-frame preview strip, “What we check” panel on the right.

Figure 1.3 — Results (shared screen)

Figure 1.3: Shared result screen — assessment, confidence and explanation on the left; supporting evidence cards on the right. Reused across text, image, and video.

History

Analysis history

Type	Claim / file	Date	Confidence	Result
Text	"Great Wall visible from space"	24 Aug	92%	Supported
Image	profile_edited.jpg	24 Aug	87%	AI-generated
Video	interview_clip.mp4	23 Aug	82%	Manipulated
Text	"Coffee stunts growth"	22 Aug	78%	Refuted

Figure 1.4: History as a proper desktop data table — type, claim/file, date, confidence, and result at a glance.

2. System architecture

React frontend talks to a FastAPI backend over REST. The backend fans out to three independent ML services — text, image, and video — each grounded in its own dataset (FEVER, GenImage, FaceForensics++). All three feed into a shared result engine that returns assessment, confidence, and explanation.

Figure 2.1: TruthLens system architecture — frontend, backend, three ML services, and the shared result engine.

Keeping the three services independent keeps the codebase easier to maintain and test in isolation.

3. Data flow

All three input types follow the same shape: submit -> POST to backend -> preprocessing -> model -> confidence + explanation back to frontend. Only the preprocessing and model step differ per type.

Figure 3.1: Request lifecycle from user submission to result returned to the frontend.

Figure 3.2: Per-type processing pipeline for text, image, and video.

4. Database design (ER diagram)

MVP uses SQLite. Two tables are enough: Analysis stores the result of each run, Evidence stores supporting sources for text claims. Uploaded files are not stored permanently in the MVP — only metadata and results.

Figure 4.1: ER diagram — Analysis (1) to Evidence (many).

5. API contracts

POST /api/verify-text

Request body:

```
{ "claim": "The Earth revolves around the Sun." }
```

Response body:

```
{ "assessment": "SUPPORTED", "confidence": 0.95, "evidence": [], "explanation": "..."
```

POST /api/analyze-image

Request: multipart/form-data, field image=<file>

Response body:

```
{ "ai_likelihood": 0.87, "confidence": 0.84, "signals": [], "explanation": "..."
```

POST /api/analyze-video

Request: multipart/form-data, field video=<file>

Response body:

```
{ "manipulation_likelihood": 0.82, "confidence": 0.79, "signals": [], "explanation": "..."
```

6. GitHub project setup

Board columns: Backlog, To do, In progress, Done.

Labels: feature, bug, documentation, frontend, backend, ml-text, ml-image, ml-video, testing, research, week-2, week-3, week-4, priority-high, priority-medium, priority-low.

Task allocation

Track	Tasks
ML — text	FEVER preprocessing, text baseline, evaluation
ML — image	GenImage preprocessing, image baseline, evaluation
ML — video	FF++ preprocessing, frame extraction, video baseline
Frontend	Home, text UI, image UI, video UI, results screen
Backend	FastAPI setup, text/image/video endpoints
Architecture (lead)	SRS, architecture, API design, integration

7. Week 2 checklist

UI: Home, text, image, video, results, and history wireframes.

Architecture: system diagram, text/image/video flowcharts, ER diagram, basic API design.

GitHub: configure project board, create labels, create issues, assign tasks, add Week 2 milestone.

Git: continue on branch 0.2 — no new branch for Week 2.
